OCLC Number: (OCoLC)231624081 Subject: Hydrologic models -- Mauritania. Excerpt: . . . computing local minima, particularly for nonlinear problems and when using gradient-based parameter estimation algorithms. A second alternative in predictive analysis is the direct estimation of nonlinear prediction limits ( Veccia and Cooley, 1989 ). This method assumes that there is a best-fit set of nonunique model parameter values. That is, there is a single global minimum objective function value ( determined, for example, using a calibrated model ), but because of the limited information content used to constrain the solution space, there are infinite combinations of parameter value that satisfy the predictive solution. This method appears to be relatively robust. One disadvantage, however, is that one complete estimation problem must be solved for each prediction limit being evaluated. A third alternative in the analysis of predictive uncertainty is the Markov-Chain Monte Carlo method ( Kuczera, 1998; Campbell and others, 1999; Bates and Campbell, 2001 ). Markov-Chain methods have become important for generating sequences of random numbers to accurately reflect complicated desired-probability distributions. In recent...
